Data permission and usage description - KinetiQ BLE Diag (individual developer)
==========

App name: KinetiQ BLE Diag
Package name: com.kinetiq.blediag
App ID: 119406053
Developer type: individual (university coursework)

Requested data permission: Basic device information (DEVICE_MANAGER)

Purpose and usage:
KinetiQ BLE Diag is an academic Bluetooth/wearables diagnostic application developed as university coursework (KinetiQ project). Within the Wear Engine scope, it calls DeviceClient.getBondedDevices() to obtain the list of the user's paired Huawei wearable devices (device identifiers, model, connection status), so that the user can explicitly select the device whose diagnostics are being performed. It may optionally subscribe to the device connection status through MonitorClient while the app screen is open.

All processing is performed on the device and is read-only. The app does not read, store or transmit any health metrics through Wear Engine, does not modify device settings, and does not send files to the device. The Huawei Health app hosts the communication channel; this app only displays diagnostic results locally on its own screen. No data is shared with any third party or server.
