User authorization path description - KinetiQ BLE Diag (individual developer)
==========

App name: KinetiQ BLE Diag
Package name: com.kinetiq.blediag
App ID: 119406053

Authorization flow:
1. The user opens KinetiQ BLE Diag. The main screen shows, among other diagnostic actions, one button labelled 'wearEngine probe'.
2. When the user taps that button, the app calls the Wear Engine requestPermission API. The Huawei Health app then displays the standard system authorization screen which lists the requested permission 'Basic device information'.
3. The user taps Allow (or Deny) on the Health authorization screen. The result is returned to the app, which shows one line of text locally (device list, or a failure note).

No background or silent authorization is used, and authorization is never re-requested automatically; it happens only when the user taps the button. The user can revoke the permission at any time from the Huawei Health app settings or by denying the dialog.

Screenshots: the app's main screen (showing the 'wearEngine probe' button) is attached. The Health authorization dialog itself appears only after the service application is approved; its standard layout will be used unchanged (per attachment disabled during review).
